

Active People Recover Faster with SporTX®

SporTX is a versatile, dual purpose stimulator that effectively treats a wide range of injuries common to active people. With positive and negative current capability, SporTX delivers the electronic equivalent of heat and ice therapy in one unit. Even more important, the therapy can be delivered directly and precisely to the point of pain or injury.

THE POSITIVE CURRENT MODE OF SPORTX

- Reduces swelling
- Helps prevent stiffness
- Helps increase range of motion

The positive mode works similar to ice to constrict blood vessels so patients see and feel improvement quickly.

THE NEGATIVE CURRENT MODE OF SPORTX

- Increases circulation
- Brings nutrient-rich blood to the injured area
- Draws fluid away from injured body tissue
- Promotes the natural healing process

The negative mode works similar to heat to dilate blood vessels and promote better blood circulation.

SPORTX OFFERS THESE OUTSTANDING BENEFITS

Efficiency

With two current modes in one unit, patients can be treated for both edema and pain with one device.

Versatility

SporTX is small and compact, easy to wear and easy to use. It works equally well in a clinic or at home.

Push Button Simplicity

Only three controls (on, off and PTM) mean SporTX is easy for anybody to use.

Programmed Treatment Mode (PTM)

This feature promotes the safe use of direct current by allowing the most efficient dosage of pulsed DC to occur within a 40 minute treatment.

Triphasic Waveform

This unique waveform has a square AC waveform that precedes the DC pulse. It is considered to be more comfortable than a spike waveform.

SporTX is a versatile stimulator that intervenes quickly and works effectively to promote the natural process of healing from the following injuries:

- | | |
|--------------------|-----------------|
| Acute ankle sprain | Shin splints |
| Acute knee sprain | Contusions |
| Shoulder sprain | Muscular strain |
| Elbow sprain | |

In the *Positive* mode, SporTX breaks the injury cycle by reducing swelling and stiffness and improving range of motion.

In the *Negative* mode, SporTX increases circulation, brings blood to the injured area and draws fluid away from body tissues.

Patients treated with SporTX can heal faster and return to a normal or active lifestyle sooner. SporTX makes sense for immediate results.
